Biological Insight to Flight Control

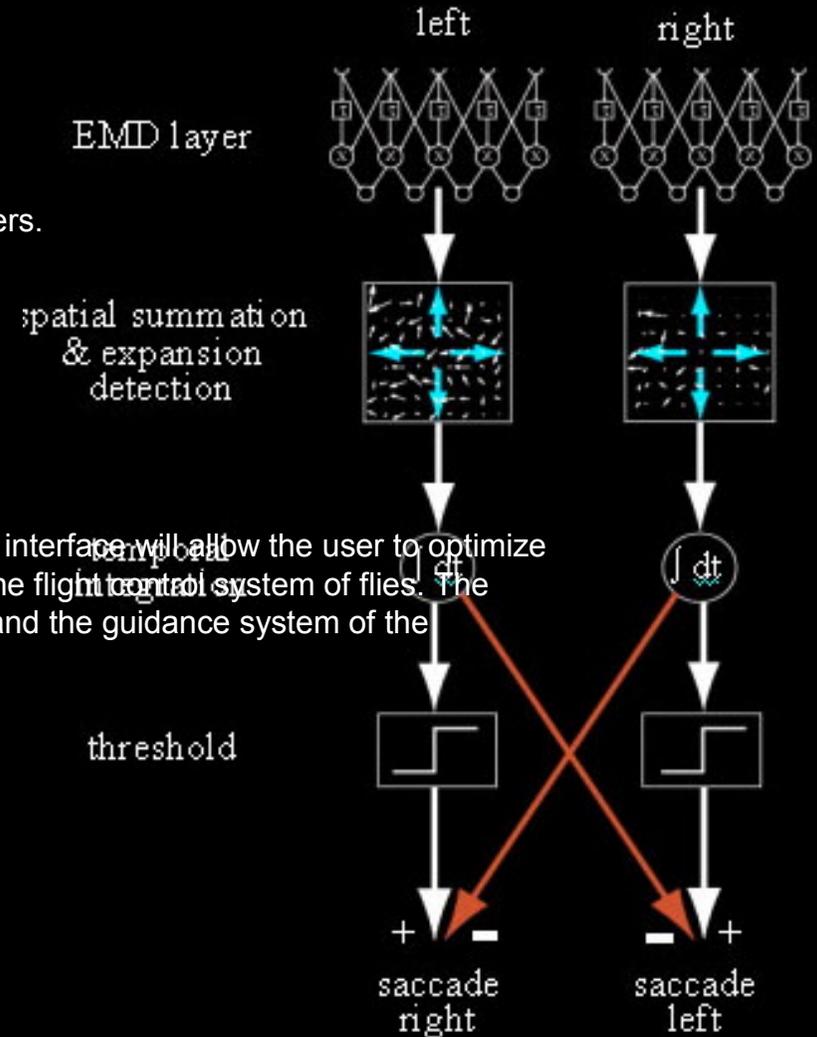

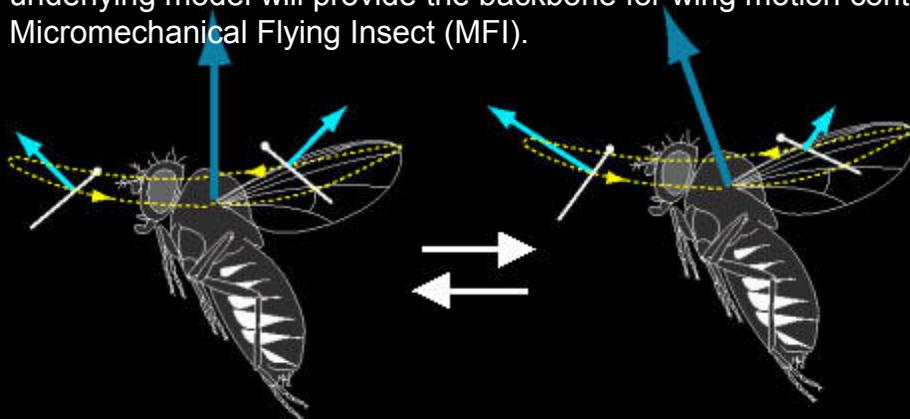

“RoboFly” Distributed Sensor Project

PROJECTED MILESTONES

- Complete measurement of free flight wing kinematics.
- Program tethered flight arena for mechanosensory closed-loop.
- Quantify influence of olfactory odors on visually-elicited flight maneuvers.
- Construct robotic gantry for testing flight control algorithms.

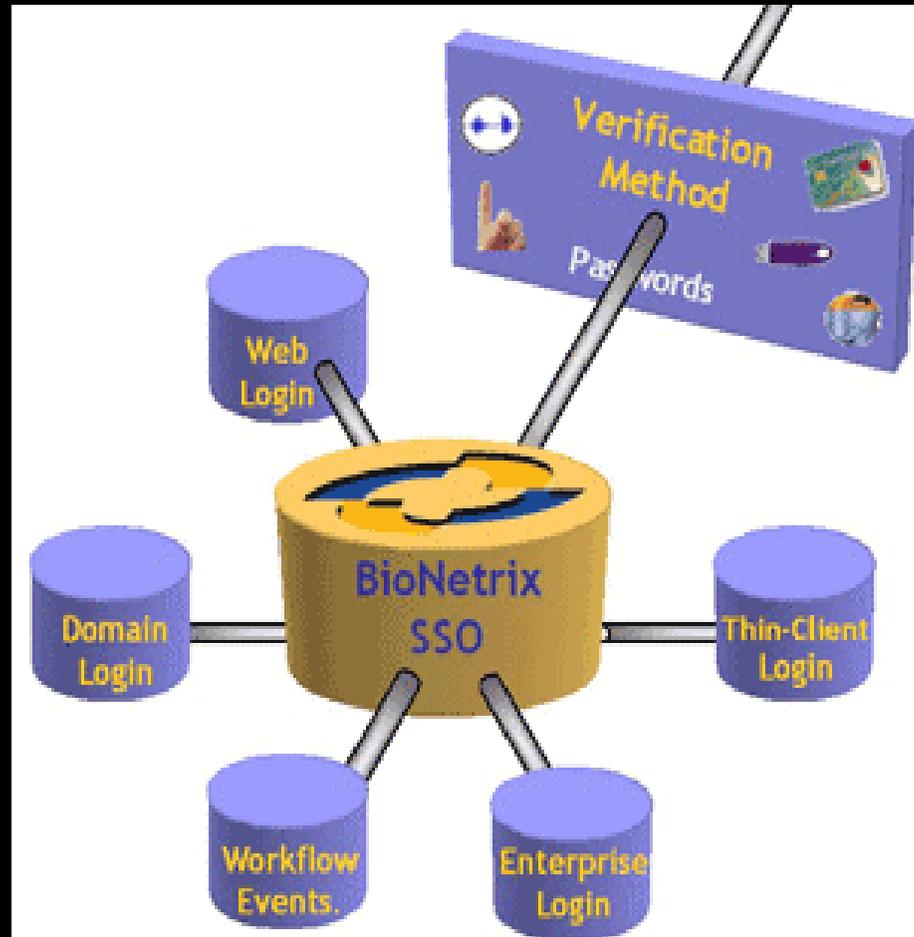

ENVISIONED DELIVERABLES

Design software for biomimetic flight control systems. A graphical user interface will allow the user to optimize features of a visual, inertial, and olfactory guidance system based on the flight control system of flies. The underlying model will provide the backbone for wing motion controller and the guidance system of the Micromechanical Flying Insect (MFI).
